COMPANY PROFILE

Our History:

With 11 years of experience, ROOF PROOF RESTORATION can assure you the best quality in every job delivered. ROOF PROOF consists of a team of more than 25 professionally trained employees, 5 site managers and a partnership where both of the directors give expert attention where needed.

Our Benefits:

Replacing your entire roof isn't always necessary to enhance its lifespan and quality. Roof restoration is a more affordable alternative to a full rooftop replacement. Our restoration system incorporates installing an energy-efficient layer over your existing roof. This membrane acts as a protective canvas for your roof and is secure, heat reflective, and leak proof.

Benefits of Roof Restoration

- Converts your hot metal roof into a cool, energy-efficient rooftop
- Gives a tough, sturdy topcoat to an existing roof
- Provides a long-lasting protection from wear and tear
- Economical and cost-effective in rooftop protection
- Will even give aged roofs high durability

Why Should You Invest In Roof Restoration from Roof Proof Restorations?

- Not at all like different brands, our restoration product bends along with the roof panels during temperature change.
- It will not only stop, but additionally prevent leaks.
- Our formula provides the roof with UV retardants, in this way reducing thermal shock by reflecting an extensive portion of the sun's rays.
- The temperature of the roof will be lower, which will likewise bring down energy costs during peak months.
- No tear-off is required, so installation does not disrupt your day-to-day business.

DAMP PROOFING

Damp Proofing is a service that needs to be undertaken when excess moisture travels to the surface of a wall damaging plaster, paint, and or brickwork. Roof proof restoration has been successfully eliminating rising damp for over 11 years with our experience and self-engineered products we ensure our clients are completely satisfied. We at roof proof restoration offer damp proofing of interior/exterior walls and basements as well to all domestic and commercial properties. A damp proofing assessment will be undertaken by a trained professional using an electronic moisture meter or thermal imaging camera.

Rising damp occurs when a wall signs of damp, mold or plaster and paint lifting. The damp proofing process will involve removing damp damaged plaster followed by injecting a chemical damp course using an injection machine, applying latex slurry to the exposed wall and re-plastering using a damp proof plaster.

Damp not only destroys your building structure but is hazardous to your health and reduces the value of your investment.
